Abstract:

A network monitoring method for reducing the traffic in the network, thereby operating the network efficiently and improving the throughput. In the network monitoring system of the present invention, wherein monitoring equipment is connected through a network with a user device with one or more control elements, the monitoring equipment transmits a request message which is received by the user device, which executes the request and stores the execution result. When the user device completes the execution concerning all the control elements, it transmits a response for notification of the completion of the execution toward the monitoring equipment with acquires the execution result by using the FTP used in the TCP/IP.
